

St James Palace.

Gas-fired condensing boilers from MHG Heating have been applied to two systems within the St James Palace complex.

The ProCon 47 and 75 wall mounted gas condensing units complete with 15m of DN80 flexible flues were installed as part of the palaces carbon reducing program.

The new boilers offer a greater level of control than the original units as they can be controlled via the occupants or via a central building management system.

The flexible flue options made the installation of boilers fully compliant with the prevailing regulations and removed the need to disturb the historic building fabric.

The versatility of the units and associated components have resulted in more MHG boilers being applied to Kensington Palace.
